

Dry Extractor

DD-B

Box Canopy
Dead Weight Fire Damper

General Description

The dry ventilator is used on all cooking equipment. The unit is ceiling hung with a recommended mounting height of 6'-6" (1981 mm) from the lower edge of the canopy to the floor. The hood is finished with a number 4 finish on three sides. The box canopy can be tapered to fit into kitchens with ceilings as low as 7'-6" (2286 mm). The dry ventilator is available with fluorescent or incandescent lights wired to a J-box.

Efficiency

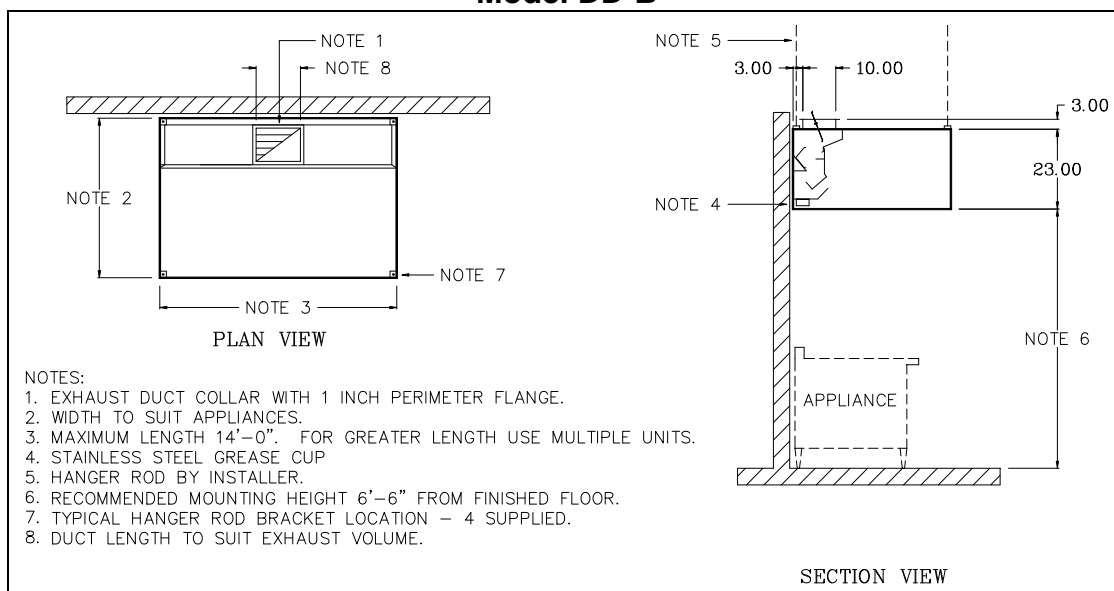

The hood is equipped with a high efficiency type "D" grease extractor. The high efficiency is achieved by applying maximum centrifugal force to the grease, dirt and lint particles through multiple, and abrupt, high velocity exhaust air direction changes.

The grease extractor design incorporates a vortex collection chamber, where the exhaust air accelerates 270 degrees around the vortex baffles and a secondary Variflow baffle for adjustable exhaust air flow. The vortex baffle is removable for periodic cleaning.

Exhaust and Supply

The total exhaust required to properly ventilate a commercial kitchen is directly related to the type of cooking equipment under the ventilator. An exhaust flow rate between 150 and 350 CFM/ft (233 and 544 l/s /m) is satisfactory for most applications. For detailed calculations refer to the *Spring Air Systems Ventilator Engineering Manual exhaust air section*. Introducing fresh air back into the kitchen is good engineering practice. An adequate supply of fresh air eliminates cold drafts, and hot spots, enhances the capture capability of the dry ventilator and results in a more comfortable kitchen environment. A supply volume between 80 and 90% is recommended. The fresh air should be heated to between 50 and 75F (13 and 24C).

Model DD-B

Engineering Data

Ventilator Length		Exhaust Flow Rate (EFR*)											
		Exhaust @ 250 CFM/ft (388 l/s/m)				Exhaust @ 300 CFM/ft (465 l/s/m)				Exhaust @ 350 CFM/ft (544 l/s/m)			
(ft)	(mm)	Exhaust volume (CFM)	Exhaust volume (l/s)	Exhaust Duct 10 in x	Exhaust Duct 254 in x	Exhaust volume (CFM)	Exhaust volume (l/s)	Exhaust Duct 10 in x	Exhaust Duct 254 in x	Exhaust Volume (CFM)	Exhaust Volume (l/s)	Exhaust Duct 10 in x	Exhaust Duct 254 in x

* Refer to the Ventilator Engineering Manual for Exhaust Volumes and Flow Rates not shown above.

Exhaust Flow Rate		Static Pressure at Duct Collar	
CFM/ft	l/s/m	in W.C.	kpa
150	233	0.62	0.155
250	388	1.00	0.250
300	465	1.26	0.315
350	544	1.15	0.288
400	620	1.38	0.345

Notes:

- Exhaust duct can be located anywhere along length of ventilator, discharge out the top, back or front.

bushing and edge seals shall be fully accessible through front removable grease inserts within the hood canopy. The grease trough shall be constructed of stainless steel with a stainless steel grease cup. The exhaust fire damper shall be an arrangement "D", butterfly type, constructed of stainless steel with blade and edge seals. The fire damper shall be activated by a fusible link and dead weight arrangement. The hood shall have _____ incandescent/fluorescent lights evenly spaced along the length of the hood.

Spring Air Systems Model No. DD-B Hood Specification

The dry extractor shall be a Spring Air Systems model no. DD-B, box canopy, high efficiency, dry ventilator, UL/ULC listed, and built in accordance with NFPA-96. The unit casing shall be a minimum 18 GA. stainless steel on all exposed surfaces.

The ventilator shall have a full length high velocity slot, a centrifugal vortex chamber, and a Variflow baffle. The vortex chamber shall provide a full 270 degree turn. The chambers, Variflow baffle, and the fire damper blades,
